

## Mammogram

- X-ray examination for breast
- It is used to look for any changes occurring in the breasts
- The amount of radiation that the patient is exposed to during the examination is very low.

### When will you find your visit?

Make sure you are not pregnant or breastfeeding.

### How do you prepare for the test?

It is preferable to wear two pieces because you need to remove the upper piece.

### How is the examination done?

The breast will be placed between two plastic layers for a few second with little pressure during the capture of a radiograph. The examination takes approximately 20 minutes.

### Examination Result

If the doctors suspect that there is something, they may take another picture or undergo another examination.
